2. Preliminaries

2.1 Data Manipulation

2.1.1 Getting Started

```
#creates a vector of evenly spaced values
x = torch.arange(12, dtype=torch.float32)
x
```

```
tensor([ 0.,  1.,  2.,  3.,  4.,  5.,  6.,  7.,  8.,  9., 10., 11.])
```

```
#outputs the amount of element in the tensor
x.numel()
```

```
12
```

```
#outputs the shape (dimensions) of the tensor
x.shape
```

```
torch.Size([12])
```

```
#reshape method amount of element must match the amount of element in original array
X = x.reshape(3, 4) #or x.reshape(3,-1) reshape can automatically figure out
X
```

```
tensor([[ 0.,  1.,  2.,  3.],
        [ 4.,  5.,  6.,  7.],
        [ 8.,  9., 10., 11.]])
```

```
#creates a tensor of zeros with the shape provided with the tuple
torch.zeros((2, 3, 4))
```

```
tensor([[[0., 0., 0., 0.],
         [0., 0., 0., 0.],
         [0., 0., 0., 0.]],

        [[0., 0., 0., 0.],
         [0., 0., 0., 0.],
         [0., 0., 0., 0.]]])
```

```
#creates a tensor of ones with the shape provided with the tuple
torch.ones((2, 3, 4))
```

```
tensor([[[1., 1., 1., 1.],
         [1., 1., 1., 1.],
         [1., 1., 1., 1.]],

        [[1., 1., 1., 1.],
         [1., 1., 1., 1.],
         [1., 1., 1., 1.]]])
```

Its also possible to create a tensor with random entries from based on a given probabilty distribution, eg. a gaussian normal distribution

```
#creates a tensor with elements drawn from a standard Gaussian (normal) distribution with mean 0 and standard deviation 1
torch.randn(3, 4)
```

```
tensor([[-0.2820, -1.0460,  0.5474,  1.5674],
        [ 0.4035, -0.7775, -0.4277, -1.0743],
        [ 0.3182,  1.6385, -1.6004,  0.6005]])
```

Its also possible to create a tensor by manually providing the values

```
torch.tensor([[2, 1, 4, 3], [1, 2, 3, 4], [4, 3, 2, 1]])
```

```
tensor([[2, 1, 4, 3],
        [1, 2, 3, 4],
        [4, 3, 2, 1]])
```

2.1.2 Indexing and Slicing

```
#Can be indexed and sliced like a python list
X[-1], X[1:3]
```

```
(tensor([ 8.,  9., 10., 11.]),
 tensor([[ 4.,  5.,  6.,  7.],
         [ 8.,  9., 10., 11.]]))
```

```
#Can also assign a value to a position in the tensor
X[1, 2] = 17
X
```

```
tensor([[ 0.,  1.,  2.,  3.],
        [ 4.,  5., 17.,  7.],
        [ 8.,  9., 10., 11.]])
```

```
#Can also assign value to multiple positions in the tensor
X[:2, :] = 12 #this code assigns the value to row 1 and 2, at each column of the 2nd order tensor
X
```

```
tensor([[12., 12., 12., 12.],
        [12., 12., 12., 12.],
        [ 8.,  9., 10., 11.]])
```

2.1.3 Operations

We can apply an elementwise operation or operations that apply a scalar operation to each element of the tensors, it can be unary operation (F : R -> R) or a function that takes one real number input and applies a scalar operation that outputs a real number

```
torch.exp(x) #applies an exponential function to each element of a tensor
```

```
tensor([162754.7969, 162754.7969, 162754.7969, 162754.7969, 162754.7969,
        162754.7969, 162754.7969, 162754.7969,   2980.9580,   8103.0840,
         22026.4648,  59874.1406])
```

Or we can also apply binary operations (F: R, R -> R) or functions that takes two real number and does a function to output a single scalar real number

```
x = torch.tensor([1.0, 2, 4, 8])
y = torch.tensor([2, 2, 2, 2])
x + y, x - y, x * y, x / y, x ** y #applies different binary operations between two same sized vectors
```

```
(tensor([ 3.,  4.,  6., 10.]),
 tensor([-1.,  0.,  2.,  6.]),
 tensor([ 2.,  4.,  8., 16.]),
 tensor([0.5000, 1.0000, 2.0000, 4.0000]),
 tensor([ 1.,  4., 16., 64.]))
```

It is also possible to concatenate two tensors

```
X = torch.arange(12, dtype=torch.float32).reshape((3,4))
Y = torch.tensor([[2.0, 1, 4, 3], [1, 2, 3, 4], [4, 3, 2, 1]])
torch.cat((X, Y), dim=0), torch.cat((X, Y), dim=1)
```

```
(tensor([[ 0.,  1.,  2.,  3.],
         [ 4.,  5.,  6.,  7.],
         [ 8.,  9., 10., 11.],
         [ 2.,  1.,  4.,  3.],
         [ 1.,  2.,  3.,  4.],
         [ 4.,  3.,  2.,  1.]]),
 tensor([[ 0.,  1.,  2.,  3.,  2.,  1.,  4.,  3.],
         [ 4.,  5.,  6.,  7.,  1.,  2.,  3.,  4.],
         [ 8.,  9., 10., 11.,  4.,  3.,  2.,  1.]]))
```

It is also possible to do a binary operation between 2 tensors

```
X == Y
```

```
tensor([[False,  True, False,  True],
        [False, False, False, False],
        [False, False, False, False]])
```

```
X.sum() #returns a tensor of a single entry with the sum of all entries in the tensor
```

```
tensor(66.)
```

2.1.4 Broadcasting

broadcasting is a technique that allows operations between tensors of different shapes by automatically expanding their dimensions to be compatible for element-wise operations

```
a = torch.arange(3).reshape((3, 1))
b = torch.arange(2).reshape((1, 2))
a, b #here the two tensors created doesnt have a matching dimension
```

```
(tensor([[0],
         [1],
```

```
            [2]]),
     tensor([[0, 1]]))
```

It essentialy copies the tensor a columnwise and tensor b rowwise and proceed with its operation

```
a + b
```

```
tensor([[0, 1],
        [1, 2],
        [2, 3]])
```

2.1.5 Saving Memory

```
before = id(Y)
Y = Y + X
id(Y) == before
```

```
False
```

```
Z = torch.zeros_like(Y)
print('id(Z):', id(Z))
Z[:] = X + Y
print('id(Z):', id(Z))
```

```
id(Z): 140354388626144
id(Z): 140354388626144
```

```
before = id(X)
X += Y
id(X) == before
```

```
True
```

2.1.6 Conversion to other python objects

```
A = X.numpy()
B = torch.from_numpy(A)
type(A), type(B)
```

```
(numpy.ndarray, torch.Tensor)
```

```
a = torch.tensor([3.5])
a, a.item(), float(a), int(a)
```

```
(tensor([3.5000]), 3.5, 3.5, 3)
```

2.2 Data Preprocessing

```
import os

os.makedirs(os.path.join('..', 'data'), exist_ok=True)
data_file = os.path.join('..', 'data', 'house_tiny.csv')

    f.write('''NumRooms,RoofType,Price

```
